Seminar paper from the year 2014 in the subject Medicine - Pharmacology, grade: 100%, University of South Florida, course: NUR 4128, language: English, abstract: Currently, heart disease remains the leading cause of death while cardiac arrest is one of the most devastating conditions patients and their families have to face. Despite all efforts to explain management of cardiac arrest and implementation of advanced cardiovascular life support (ACLS), survival rates post cardiac arrest remains at 23.9 % in adults and 40.2% in children (AHA, 2012). Nurses undergo

extensive ACLS training every two years. While algorithms, administration of emergency drugs, and procedures seem to be followed appropriately, rationales of the latter are often not well understood. In this paper pharmacokinetics and pharmacodynamics, adverse effects of ACLS drugs, drug-drug interactions of intervention drugs, and anticipated long-term adverse effects post cardiac arrest will be discussed. In the case study of JG, the patient went into cardiac arrest on the way to the hospital and he was pronounced after a full code had been performed for three hours. The cause of his cardiac arrest in regards to heart rhythm is unclear and no medical history is available. 20-1110

Literature Review from the year 2017 in the subject Medicine - Hospital Environment, Clinical Medicine, grade: 1, Egerton University, language: English, abstract: Over the years, the American Heart Association has made outstanding contributions and numerous improvements to cardiopulmonary resuscitation and advanced cardiac life support guidelines. It is due to adequate use of resources and continuous research that millions of lives are saved in the United States. Such guidelines serve health care providers and other members of the healthcare team as a resource to ensure adequate and timely response to those individuals who experience cardiac or respiratory arrest. However, according to AHA statistics, "More than 326,000 people in the US suffer out-of-hospital cardiac arrests each year. Statistics prove that if more people knew CPR, more lives could be saved" (American Heart Association, 2016). In other words, dissemination of knowledge on the matter has direct outcomes on increasing survival rates. Therefore, the guidelines and the implementation methods are on continuous review based on new evidence. It is important to provide those who suffer cardiac or respiratory arrest with timely services because delays could end up affecting the outcome of those who experience reversible damage. Healthcare providers around the world have become informed on the benefits of updated competence and direct patient outcomes and quality of care. The American Heart Association has published the new 2015 cardiopulmonary resuscitation guidelines, where changes and

updates are reflected in an effort to put the best available evidence in practice. The purpose of this review is to compare the 2015 AHA updates with historical evidence in an attempt to explicate the implications and limitations of pharmacology in advanced cardiac life support. Describes management of neuroendovascular complications, focusing on tips and tricks for 'bailout' procedures. This extensively updated textbook comprehensively reviews the latest developments in evidence-based critical care. Topics are covered in a case study format with an emphasis on the principles of diagnosis and therapy. Each topic is covered using a variety of case studies and features a case vignette, clinical question and an additional discussion section to clarify areas of particular importance. Topics including cytokine release syndrome, sympathomimetic overdose and palliative care in the intensive care unit have been extensively revised, while new sections focusing on neuromuscular disease and subarachnoid hemorrhages have been added. Evidence-Based Critical Care, 2nd edition is a critical resource for critical care practitioners, fellows, residents; allied health professionals and medical students who wish to expand their knowledge within critical care. The case study-based approach taken in the textbook makes this an ideal resource for those preparing for board examinations. 20-1132 Product 15-1064 Mastering ACLS, Second Edition will help health care professionals successfully complete the American Heart Association's Advanced Cardiac Life Support course and certification exam. This quick-review outline-format study guide covers the core knowledge and skills needed for ACLS—including detailed, illustrated life support techniques, core case studies, arrhythmias, defibrillation procedures, I.V. techniques, cardiovascular pharmacology, myocardial infarction, and special resuscitation situations. Now in full color, this edition features 200 illustrations and algorithms, expanded chapter quizzes, a comprehensive test, expanded information on automated external defibrillators, and additional case scenarios in the Megacode and other chapters. A new appendix reviews Basic Cardiac Life Support guidelines. 20-1120 This

program provides information to ACLS providers, expert clinicians and scientists on advanced resuscitation procedures. It demonstrates how to assess and manage critical cardiovascular emergencies not currently addressed in ACLS. It may also be used as adult continuing education for learners who wish to improve their knowledge and skills in ACLS but are not required to document successful completion of the ACLS-EP course.
